Subject: Submission of Original Research Manuscript

Dear Editor-in-Chief,

Please consider our original research manuscript, ‘**Record-Level Evaluation of a Morlet CNN–Conformer for Five-Class ECG Beat Classification**,’ for publication in *Revista Portuguesa de Cardiologia*.

Automatic electrocardiogram (ECG) beat classification and arrhythmia screening are cornerstone capabilities for modern cardiovascular telemonitoring, wearable cardiac devices, and hospital telemetry. However, common methodological pitfalls—notably random beat-level data splitting and opaque summary metrics—often mask severe model failures on critical minority arrhythmias (such as supraventricular ectopic beats and fusion beats).

In this work, we present a patient-independent, record-level evaluation of a 32-scale Morlet continuous wavelet transform coupled with a Conformer sequence encoder on 45 MIT–BIH records. While the Conformer architecture achieved superior aggregate performance (accuracy 0.60, macro-F1 0.26, weighted-F1 0.68) compared to CNN-attention, CNN-LSTM, and baseline CNN models, our failure-aware analysis shows that performance gains were concentrated almost exclusively in dominant classes (Normal and ventricular ectopic beats), with near-zero recognition of rare arrhythmias. We provide a thorough error matrix, threshold sensitivity, and calibration diagnostic to establish realistic boundaries for deep learning translation in clinical cardiology.

Author Declarations and Confirmations:

1. **Originality:** This manuscript is original, has not been published elsewhere, and is not concurrently submitted to any other journal.
2. **Authorship Approval:** All co-authors have reviewed, contributed to, and approved the final manuscript.
3. **Competing Interests:** The authors declare no financial or personal conflicts of interest.
4. **Funding:** This research received no specific grant from public, commercial, or non-profit funding bodies.
5. **Ethics:** Ethical approval and informed consent were not required as this computational study utilized the open-access, fully de-identified MIT–BIH dataset via PhysioNet.
6. **Reproducibility:** Complete source code, model checkpoints, and prediction arrays are publicly available in our versioned GitHub release.

Thank you very much for your consideration of our manuscript.

Sincerely yours,

Alireza Abbaszadeh (Corresponding Author)
